

Database Project Proposal Form		
Project Title:	Student Management System	
TA Name:	Mai Shreif	
Students' names:	<i>ID Number</i>	<i>Name</i>
1-	24030028	Youssef Malak
2-	24030035	Mohammed Salah
3-	24030138	Shady Keroslos
4-		
5-		
Statement of Problem:	Many educational institutions still rely on manual or paper-based systems to manage student records, course enrollments, and attendance. This leads to data inconsistency, difficulty in retrieving student information, and inefficiency in academic administration. This project aims to solve these problems by designing a relational database system that centralizes all student-related data and supports efficient academic management.	
Brief Description of the Project:	A Student Management System is a database-driven application that organizes and stores student academic and personal records. The system manages student registration, course enrollment, grades, and attendance. It also supports role-based access for administrators and staff, enabling efficient data retrieval and report generation.	
Objectives:	• To organize and store student academic and personal data efficiently • To manage course enrollment and grade records • To track student attendance accurately • To support role-based access for admin and staff • To enable fast search and retrieval of student records To generate academic reports for management	
Technical Approach:	• Design ER Diagram to represent system entities and relationships • Create normalized database tables (up to 3NF) • Use SQL Server as a DBMS • Implement queries using SQL (CRUD operations) • Apply database constraints and validation rules Develop a simple user interface for admin and staff - <i>SQL queries</i>	

Expected Deliverables:	• Complete database schema (tables, relationships, constraints) • ER Diagram (ERD) • SQL scripts (Create, Insert, Queries)
